

APPENDIX D

A Reader's Guide to Appendix D

Appendix D contains the Adjusted Self-Sufficiency Standard expressed as a percent of the federal poverty level for all eight counties, twelve family types, seven coverage options, and three health status levels. There are two tables for each family type in each county, one with the public coverage options and one with the private coverage options.

The family types are listed in Table 3 of the text (page 13). Each family type represents both numbers of adults and children and ages of each. Age of adult is relevant because BH and individual insurance premiums for adults are age-related (older adults pay higher premiums). Ages of children are relevant because Pearce's estimates of child care costs vary by the age of the child and therefore the most appropriate child care setting (see Appendix A and Pearce, 2001). Other living expenses such as food and clothing also vary by ages as well as numbers of dependents. All adults in each family are assumed to be working full time (and therefore have work-related expenses).

The Adjusted Standard should be interpreted to mean the resources (income) that a family needs to cover the basic living expenses estimated in Appendix C. *It is not meant as the income the family actually earns, but rather what the family needs to earn* in order to pay for its basic living expenses. Some of the coverage scenarios assume that the family qualifies for food stamps and child care subsidies. These subsidies *reduce* the out-of-pocket expenses of the family, thereby *lowering* the income required (the Standard and Adjusted Standard) to meet the remaining expenses.

The Adjusted Standards in Appendix C were divided by the 2001 federal poverty level (FPL) relevant to the number of family members. FPL figures came from <http://aspe.hhs.gov/poverty/01poverty.htm> (1/23/01). They range from \$8,590 for a single person family to \$26,710 for a family of seven.

Several of the expense categories (taxes and tax credits) are determined by the level of other expenses, making the calculation of the Adjusted Standard an iterative process. These expense categories change when other expenses do.

For purposes of calculating the Adjusted Standard, the Medicaid label represents all the Medicaid programs for which there is no cost sharing. BH/BH Plus represents the option of adults covered by BH and all dependent children covered by BH Plus. The columns with supports are based on family expenses *net of* the value of food stamps and child care expenses. As noted in Appendix C, we used the TANF income eligibility rules and income limits to determine Medicaid eligibility. Families that receive child care subsidies have much lower out-of-pocket child care expenses. Since only out-of-pocket child care expenses are deductible from income in calculating TANF income, this subsidy raised the TANF income for all of family types in all counties above the relevant TANF income limits. Thus, none of these families were income eligible for TANF, and so we omitted them from Appendix D.¹ The WSHIP column represents the option of one family member in WSHIP and the remaining members covered by individual policies. Additional detail on coverage options appears in the text beginning on page 14.

¹ See Table 9 (page 27) in the text for the TANF income limits and an illustrative eligibility calculation.

There are three rows representing the three health status levels (healthy, average, and sick). Healthy families are assumed to have no health care expenses above the premiums they pay for their coverage option. Average and sick families have both premiums and out of-pocket expenses for some combination of deductibles, co-payments, and coinsurance (see text, page 16-17). We assume no cost sharing of any kind for families covered by Medicaid for the calculations in Appendix D.

Adjusted Self-Sufficiency Standard as a Percent of Federal Poverty Level for all Family Types, Public and Private Programs, in Eight Washington Counties
